

## What Your Dog's Breed Composition Means

### Level 1

This category will only report when a dog's DNA contains a majority of a specific breed (75% or greater). Most mixed breed dogs will not usually have a breed in this category unless one or both of their parents are purebred.

### Level 2

This category reports breeds that are easily recognizable within your dog. While these breeds may have a strong influence on your dog, each breed listed makes up less than the majority of your dog's DNA, between 37%-74%. This can mean that one of the parents was a purebred.

### Level 3

This category identifies breeds that have between 20%-36% of the listed breed(s). Although still recognizable, a breed at this level indicates a mix and is often carried down from the parents of your dog's parents.

### Level 4

This category represents 10%-20% of the breed DNA, usually carried over from previous generations in your dog's ancestry. Although it is a smaller representation of your dog's DNA make-up it is often still recognizable.

### Level 5

This level represents the lowest level of breed found in your dog, occurring at 9% or less. Although not always physically apparent, it still appears at a low and measurable amount in your dog's DNA.
